

**Abstract**

An ostomy appliance cover that includes a first sheet of flexible material having at least one low coefficient of friction surface and dimensioned to cover a first portion of the ostomy appliance, and a second sheet of flexible  
5 material that is elastic and breathable, dimensioned to cover a second portion of the ostomy appliance. The second sheet of material includes an expandable opening, which when expanded allows the ostomy appliance to pass through the opening without substantial distortion of the ostomy appliance, and when released substantially covers the colostomy appliance in cooperation with the  
10 first sheet of material.
